DemoThermometryDICOM

November 13, 2021

1 Demo of Proteus MR Thermometry

This notebook illustrates the basic operation to use Proteus MR Thermometry library

Be aware some of the underlying structure for the processing is aligned how the main Proteus GUI application organizes the data.

[73]:
```
%matplotlib inline
import matplotlib.pyplot as plt

import numpy as np
from Proteus.ThermometryLibrary import ThermometryLib
from Proteus.File_IO.H5pySimple import ReadFromH5py, SaveToH5py
import tables
import logging
from pprint import pprint
from Proteus.ThermometryLibrary.ThermometryLib import  LOGGER_NAME

from skimage import data, img_as_float
from skimage import exposure
import warnings
```

```
logger = logging.getLogger(LOGGER_NAME)

stderr_log_handler = logging.StreamHandler()
logger.addHandler(stderr_log_handler)

formatter = logging.Formatter('%(asctime)s - %(name)s - %(levelname)s -␣
↪%(message)s')

logger.setLevel(logging.ERROR) #use logging.INFO or logging.DEBUG for detailed␣
↪step information for thermometry

stderr_log_handler.setFormatter(formatter)

logger.info(': INITIALIZING MORPHEUS application, powered by Proteus')
```

1.1 Functions and classess required to prepare the MR processing

[74]:
```
def CompareTwoOrderedLists(list1,list2,bPrintResults=False):

/Users/spichardo/.edm/envs/MORPHEUS/lib/python3.6/site-
packages/ipykernel_launcher.py:37: UserWarning: The DICOMS are missing
TriggerTime in their Metadata,
 so there is no automatic way to recover the timing
```

We use the UnitTest class for demonstration to reprocess MRI data

[169]:
```
ut = UnitTest() #Instantiate a parent class
ut.ep = ThermometryLib.EntryProcessing(*ut.
 ↪ReturnElementsToInitializeprocessor()) #Instantiate an entry processor␣
 ↪member on the parent class
ut.ep.ImagingFields = ut.ImagingFields #Instantiate a class full of image␣
 ↪processing parameters
ut.ep.ImagingFields.Beta=1.5
ut.ep.ImagingFields.ROIs='1 C 3 -13 -18'
ut.ep.ImagingFields.UserDriftROIs='-1 R 70 50 0 -10'
ut.ep.ImagingFields.UseUserDriftMask = True
ut.ep.ImagingFields.T_tolerance =2.0
ut.ep.ImagingFields.StartReference =1
ut.ep.ImagingFields.NumberOfAverageForReference=4
```

We print the original parameters for thermometry processing

[170]:
```
for k in dir(ut.ep.ImagingFields):
    if '_' not in k:
        print(k,getattr(ut.ep.ImagingFields,k))
```

We process the magntiude and phase data. We also use the CompareTwoOrderedLists to show that the repreocess thermometry is the same as in the original dataset

[171]:
```
ut.BatchProccessorFromList(ListDataExample) #Parent class must posses a method␣
↪directing the processing of entries
```

[ ]:
```

```

We now can plot the different imaging data (magnitude, phase, thermal and supportive mask)

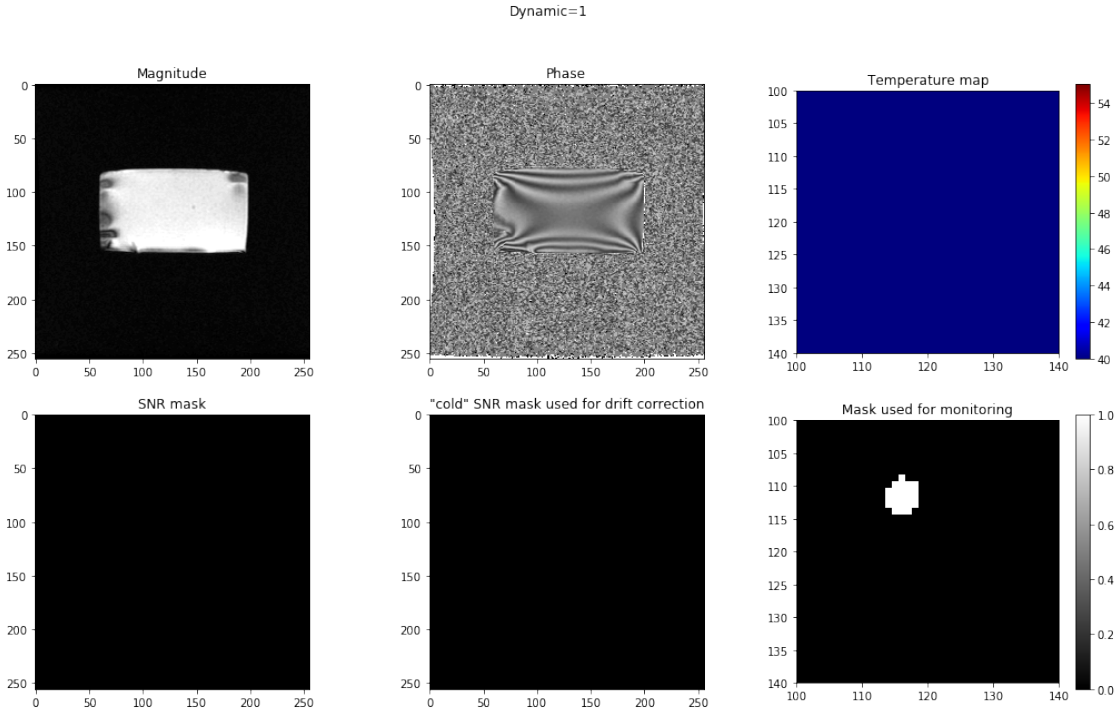
[172]:
```
Main=ut.MainObject

def PlotImages(nDynamic, Main,gtitle):
    IMAGES=Main.IMAGES
    plt.figure(figsize=(18,10))
    plt.subplot(2,3,1)
```

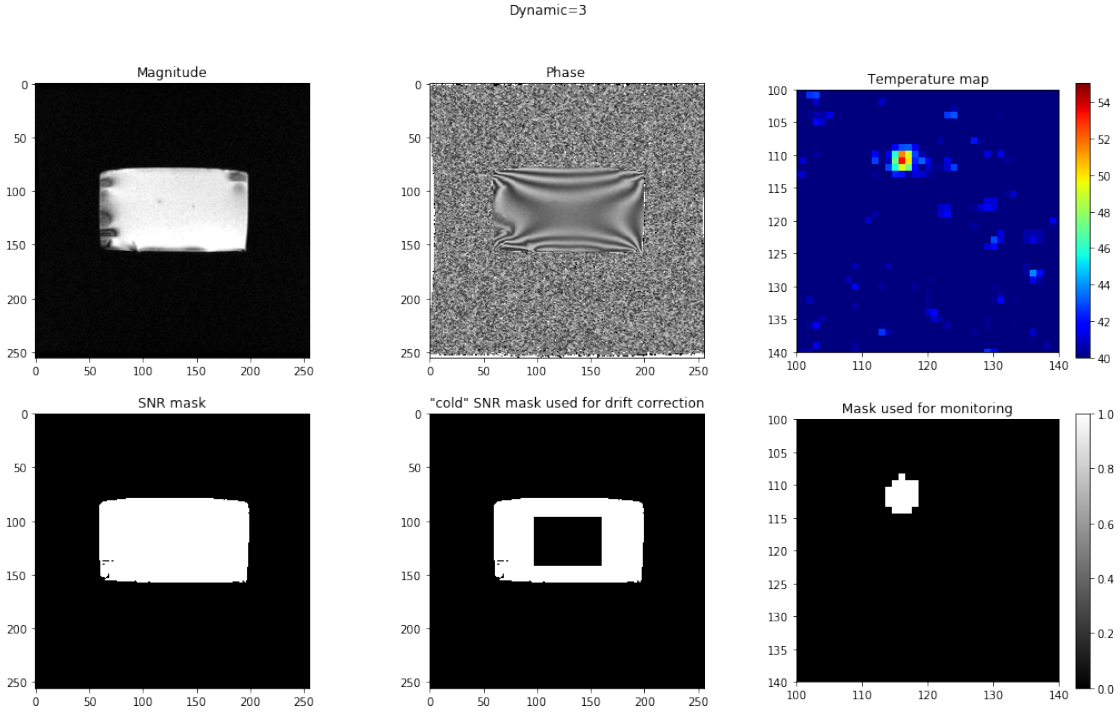
```
    p2, p98 = np.
↪percentile(IMAGES['Coronal']['Magnitude'][nDynamic][0]['data'], (2, 98))
    img_rescale = exposure.
↪rescale_intensity(IMAGES['Coronal']['Magnitude'][nDynamic][0]['data'],␣
↪in_range=(p2, p98))
    plt.imshow(img_rescale,cmap=plt.cm.gray)
    plt.title('Magnitude')
    plt.subplot(2,3,2)
    plt.imshow(IMAGES['Coronal']['Phase'][nDynamic][0]['data'],cmap=plt.cm.gray)
    plt.title('Phase')
    plt.subplot(2,3,3)
    plt.
↪imshow(IMAGES['Coronal']['Temperature'][nDynamic][0]['data'],vmin=40,vmax=55,cmap=plt.
↪cm.jet)
    plt.xlim(100,140)
    plt.ylim(140,100)
    plt.colorbar()
    plt.title('Temperature map')

    plt.subplot(2,3,4)
    plt.
↪imshow(IMAGES['Coronal']['Temperature'][nDynamic][0]['SNR_Mask'],cmap=plt.cm.
↪gray)
    plt.title('SNR mask')
    plt.subplot(2,3,5)
    plt.
↪imshow(IMAGES['Coronal']['Temperature'][nDynamic][0]['SNR_ColdMask'],cmap=plt.
↪cm.gray)
    plt.title('"cold" SNR mask used for drift correction')
    plt.subplot(2,3,6)
    #note that the mask for ROI monitoring is constant accross all image and it␣
↪is stored in the TemporaryData
    plt.imshow(Main.TemporaryData['Coronal'][0]['MaskAverage']*1.0,cmap=plt.cm.
↪gray)
    plt.title('Mask used for monitoring')
    plt.xlim(100,140)
    plt.ylim(140,100)
    plt.colorbar()
    plt.suptitle(gtitle)

PlotImages(1,Main,'Dynamic=1')#
PlotImages(3,Main,'Dynamic=3')#
PlotImages(5,Main,'Dynamic=5')#
```



Dynamic=1
Magnitude
Phase
Temperature map
SNR mask
"cold" SNR mask used for drift correction
Mask used for monitoring



Dynamic=3
